The Rust Guide mentions the. and src directories when introducing the standard library. What is the difference between them? A: In most programming languages, the source code files are kept in one location (as opposed to a location per project). For libraries like the standard library, it is generally useful to keep them in a single location. However, there is often a system to keep the source code in a "project-style" layout, that is: a folder structure roughly like src/, rust/, tools/. What I consider to be "standard" is to keep all the source code in src/. This is, for example, the case for Rust's standard library, and it would be hard to use a different layout without a lot of work. There are many other languages that do not follow this "standard". Some examples are the IDEs, which often have their own peculiar directory layout, or language/target-specific source code locations. src is just the source of the library.
